EXECUTIVE SUMMARY

The South Carolina Department of Transportation (SCDOT) proposes multiple improvements to the I-26 corridor from mile marker 85 – SC 202 to mile marker 101 – Broad River Road (US 176) designed to increase capacity, upgrade interchanges to meet design requirements, and expand vertical clearance at overpass bridges. Specifically, SCDOT proposes widening I-26 from four to six lanes from Exit 85 – SC 202 to Exit 97 - Broad River Road (US 176) and from four to eight lanes from Exit 97 - Broad River Road (US 176) to Exit 101 - Broad River Road (US 176). Along the project area, interchanges at Exit 85 – SC 202, Exit 91 – Columbia Avenue (S-48), and Exit 97 - Broad River Road (US 176) will be improved to bring them to compliance with design requirements.

Throughout nearly all of the study area, I-26 currently provides two lanes in each direction. From Exit 82 southeastward, the two lane section is maintained, until it is widened from two to three lanes approaching Exit 101.

The proposed project has two primary purposes: increase roadway capacity to address the projected traffic volumes and improve geometric deficiencies along the mainline and at several interchanges and overpasses in this section of I-26 by bringing them to compliance with current state and federal design standards. The secondary purpose is to improve safety which will be enhanced by improving the geometric design of the facility.

This interchange modification report (IMR) presents information for the proposed interchange modifications at Exit 85 – SC 202 located in Newberry County, SC. Today, this interchange is a partial cloverleaf interchange. Both the eastbound and westbound off- and on-ramps are located on the north side of the interchange. There is also a closely spaced frontage road (Meadow Brook Road) near the intersection of SC 202 and the westbound ramps.

Information discussed in the report is derived from the following reports: *Interstate 26 Widening Traffic Analysis Report: I-26 Widening Project MM 85-MM 101, Accident Analysis Report: I-26 Widening Project MM 85-MM 101,* and *Interstate 26 Widening and Improvements Mile Marker 85-101 Environmental Assessment.*

Five alternatives were developed for Exit 85. The five build alternatives at Exit 85 consist of:

- Alternative 1: Diamond Interchange – this concept would replace the existing interchange configuration with a diamond interchange. The eastbound and westbound off-ramp approaches to the ramp termini intersections would be controlled by STOP signs.
- Alternative 1A: Diamond Loop Interchange – this concept is similar to Alternative 1 but replaces the diamond ramp in the northeast quadrant with a loop ramp in the northwest quadrant.

- Alternative 2: Partial Cloverleaf (ParClo) Interchange – this concept would add a westbound off-ramp for traffic traveling to the north on SC 202, and eastbound on-ramp for traffic traveling from the south on SC 202 to the existing interchange configuration, along with adjustments to acceleration and deceleration lane lengths for the existing ramps. The eastbound and westbound off-ramp approaches to the ramp termini intersections would be controlled by STOP signs.
- Alternative 2A: ParClo Modified – this concept would be similar to Alternative 2 but would remove the ramp in the northeast quadrant and shift that movement to the loop ramp in the northwest quadrant.
- Alternative 3: Dual Roundabout (Bowtie) Interchange – this concept would eliminate the westbound loop off-ramp and eastbound loop on-ramp and provide for a diamond interchange with roundabouts instead of STOP sign controlled intersections at the ramp termini.

The Preferred Alternative that was selected for Exit 85 was Alternative 1A. Other elements of Alternative 1A include the relocation of Meadow Brook Road and 4 Oaks Road to provide further separation from the interchange ramps. Alternative 1a was selected as the Preferred Alternative because it meets the purpose and need, has the lowest overall construction cost, does not require any residential or commercial relocations, requires the lowest acreage of new right-of-way, and results in the lowest impact to streams making it the least environmentally damaging practicable alternative. Therefore, this alternative was selected as the Preferred Alternative. Alternative 1A is shown in Figure **E-1**.

Based on the traffic analysis of the Preferred Alternative 1A, no additional improvements are necessary.

Figure E-1. Preferred Alternative 1A

I. Introduction

I-26 is an east-west interstate highway that begins at the junction of U.S. Route 11W and U.S. Route 23 in Kingsport, Tennessee. From this origin, I-26 runs generally southeastward through Tennessee, North Carolina, and South Carolina, where it ends at U.S. Route 17 in Charleston, South Carolina.

Along its nearly 306 mile length, I-26 provides access to Johnson City, Tennessee; Asheville, North Carolina; and Spartanburg, Columbia and Charleston, South Carolina.

In South Carolina, I-26 covers about 221 miles, and provides connections to I-95 south of Providence, to I-77 south of Cayce, to I-20 west of Columbia, and to I-85 north-west of Spartanburg. The portion of I-26 under study in the *Interstate 26 Widening Traffic Analysis Report: I-26 Widening Project MM 85-MM 101* is located west of Columbia, generally between Exit 82 and Exit 102. Exit 85 is located on the west end of the study area.

In the vicinity of Exit 85, I-26 currently provides two lanes in each direction. The posted speed limit on I-26 in the vicinity of Exit 85 is 70 miles per hour.

In general, interstate routes can be characterized as having either level, rolling, or mountainous terrain. Consistent with the Mainline Study, the portion of I-26 adjacent to Exit 85 is characterized as having a rolling terrain.

Information discussed in the report is derived from the following projects reports: *Interstate 26 Widening Traffic Analysis Report: I-26 Widening Project MM 85-MM 101* (Mainline Study), *Accident Analysis Report: I-26 Widening Project MM 85-MM 101* (Accident Analysis), and *Interstate 26 Widening and Improvements Mile Marker 85-101 Environmental Assessment.*

The I-26 Mainline Study evaluated multiple improvements to the I-26 corridor designed to increase capacity, upgrade interchanges to meet design requirements, and expand vertical clearance at overpass bridges and/or replace them. The study considered widening I-26 from two to three lanes from approximately 1.6 miles west of Exit 85 to about 2,200 feet west of Exit 101 and examined modifications to interchanges at Exit 85 (SC 202), Exit 91 (S-32-48/Columbia Avenue) and Exit 97 (US 176/Broad River Road). To provide sufficient coverage to prepare interchange modification reports, the I-26 Mainline Study included the existing interchanges at Exits 82, 101 and 102. **Figure 1** depicts the study area for the overall I-26 Widening project.

Figure 1. Interstate 26 Widening Study Area

II. Exit 85 – SC 202

Exit 85 is a partial cloverleaf interchange with a loop on-ramp in the southwest quadrant and a loop off-ramp in the northwest quadrant. The existing configuration of the Exit 85 interchange is shown in **Figure 2**.

Existing Conditions

The westbound loop off-ramp is approximately 860 feet long with a 415 feet long parallel deceleration lane (with a parallel length of approximately 190 feet). The off-ramp has a 30 mph posted advisory speed limit, and widens from a single lane to provide a separate left turn lane and a separate right turn lane that are separated from each other by a grass island. The left turn lane provides approximately 40 feet of storage upstream of the stop line and is controlled by a STOP sign. The right turn lane provides approximately 110 feet of storage upstream of the stop line and is controlled by a yield sign.

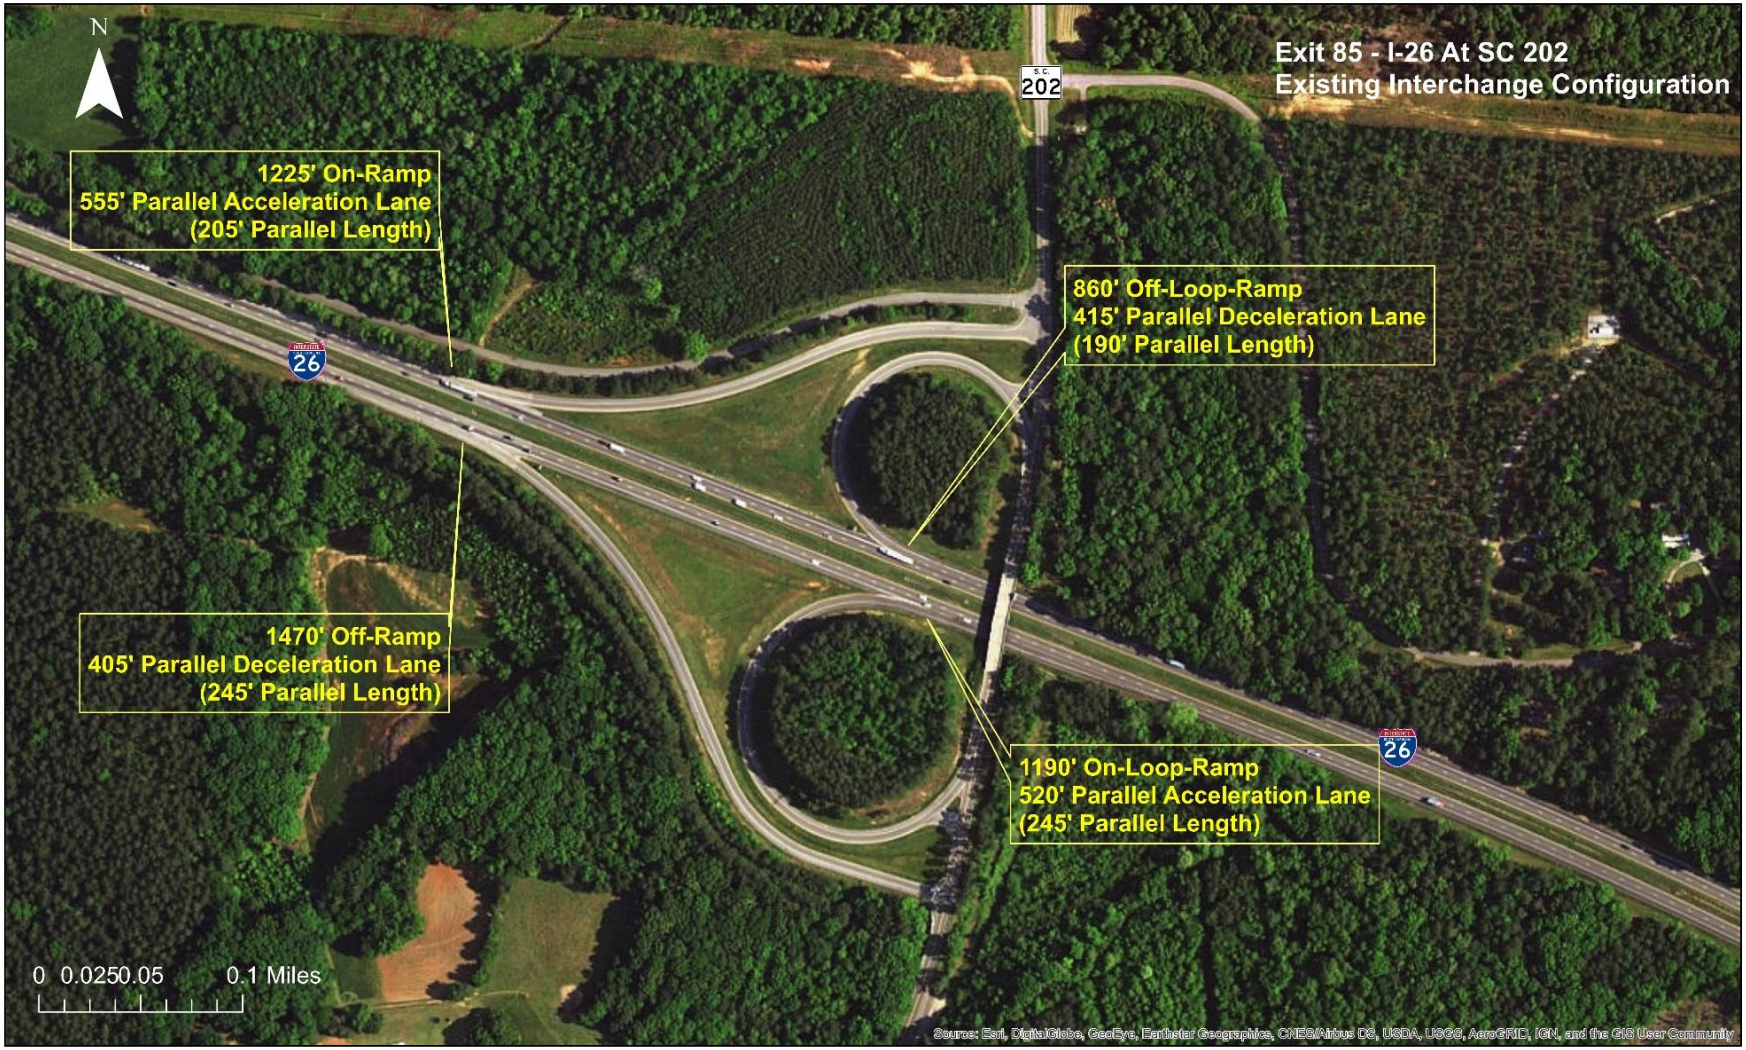
The westbound on-ramp is a single lane ramp approximately 1,225 feet long that merges into I-26 with a 555 feet long parallel acceleration lane (with a parallel length of approximately 205 feet). The ramp accepts the southbound right turn and the northbound left turn traffic from SC 202. No control is provided to either of these movements. The westbound on-ramp is adjacent to Meadow Brook Road, which is located to the north of the on-ramp and separated by approximately 45 feet.

The westbound loop off-ramp and on-ramp are separated by approximately 980 feet.

The eastbound off-ramp is approximately 1,470 feet long with a 405 feet long parallel deceleration lane (with a parallel length of approximately 245 feet). The off-ramp has a 40 mph posted advisory speed limit. The off-ramp remains a single lane until it intersects with SC 202. At the intersection traffic can make left or right turn. Both movements are controlled by the STOP signs.

The eastbound on-ramp is a single lane loop ramp approximately 1,190 feet long that merges into I-26 with a 520 feet long parallel acceleration lane (with a parallel length of approximately 245 feet). The ramp accepts the southbound right turn and the northbound left turn traffic from SC 202. Northbound left turning traffic and southbound right turning traffic are separated by a grass median; the northbound left turn traffic entering the on-ramp has to yield to the southbound right turn traffic.

The eastbound off-ramp and loop on-ramp are separated by approximately 1,050 feet.



Source: Figure 12, *Interstate 26 Widening Traffic Analysis Report*

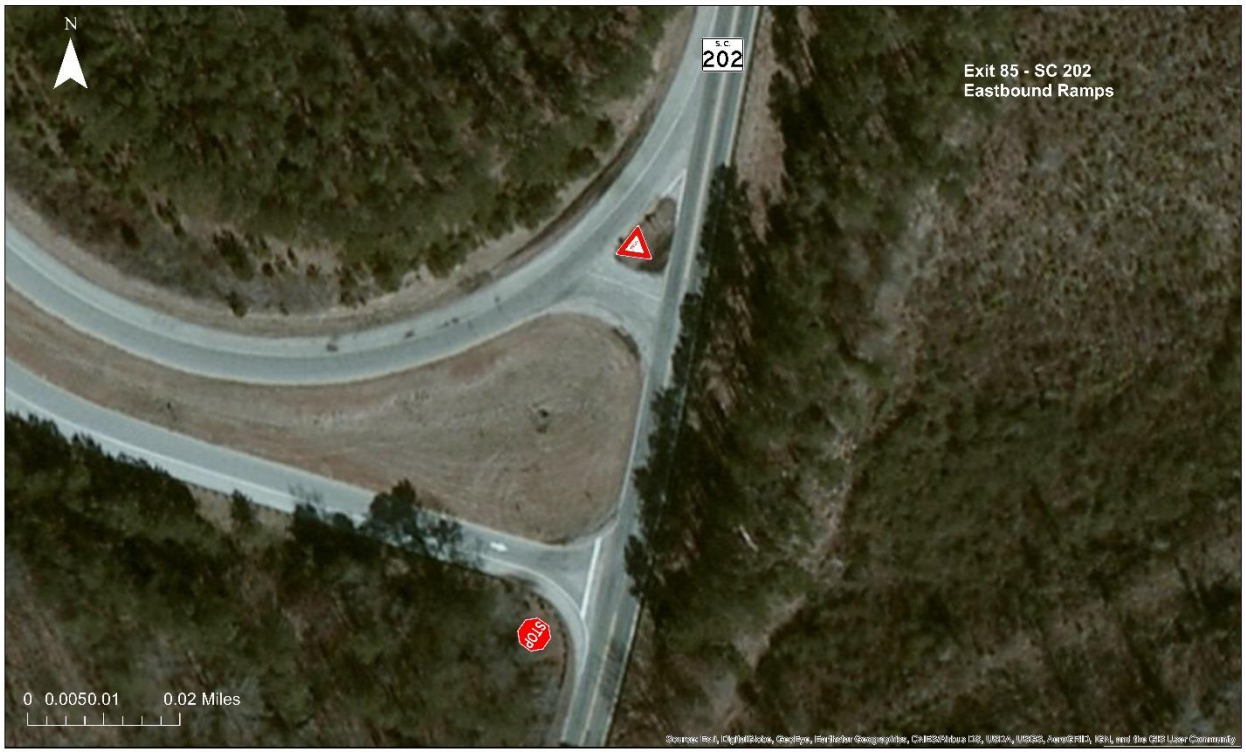
Figure 2. Existing Interchange

The exit is signed “SC 202” using the state route shields, along with the text “Pomaria” and “Little Mtn” in the westbound direction. In the eastbound direction, the SC 202 state route shield is shown along with the text “Little Mtn”.

The section of I-26 in the vicinity of Exit 85 currently consists of a four-lane interstate with a grassed median for most of its length. The existing right-of-way is approximately 50 feet to either side of the center line (100 feet total).

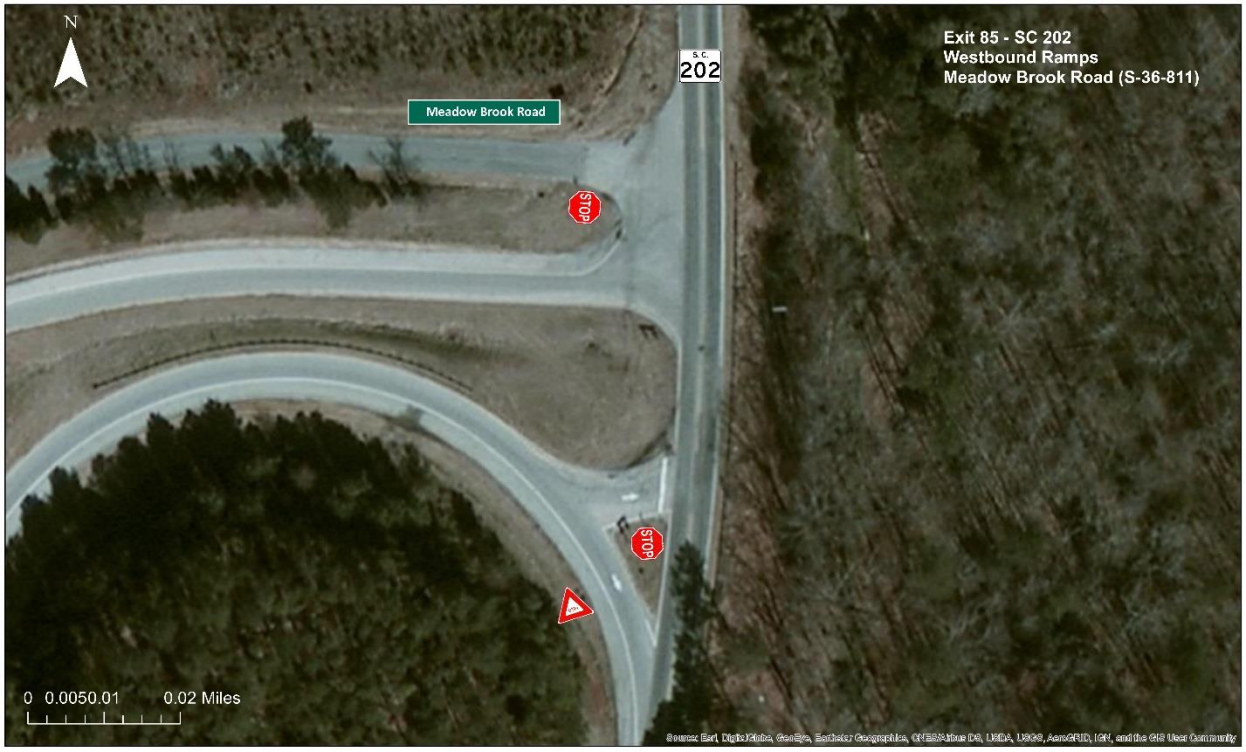
SC 202 is a two lane roadway with a posted 45 mph speed limit in the vicinity of the interchange. The SC 202 bridge crossing I-26 is two lanes wide. No dedicated turn lanes are provided for northbound left turn traffic from SC 202 merging into the eastbound loop on-ramp. However, there is a small island at the point of its merging with southbound right turn traffic from SC 202. Left turn traffic onto the eastbound loop on-ramp has to yield to southbound right turn traffic.

At the westbound on-ramp intersection, no vehicle storage turn lanes are provided for northbound left turn traffic or the southbound right turn traffic from SC 202. However, there is a wider section of pavement between the westbound on-ramp and Meadow Brook Road that could be used as a southbound right turn lane onto the ramp. The eastbound ramp intersection is shown in **Figure 3**. The westbound ramp intersection is shown in **Figure 4**.



Source: Figure 13, *Interstate 26 Widening Traffic Analysis Report*

Figure 3. Exit 85: SC 202 at Eastbound Ramps



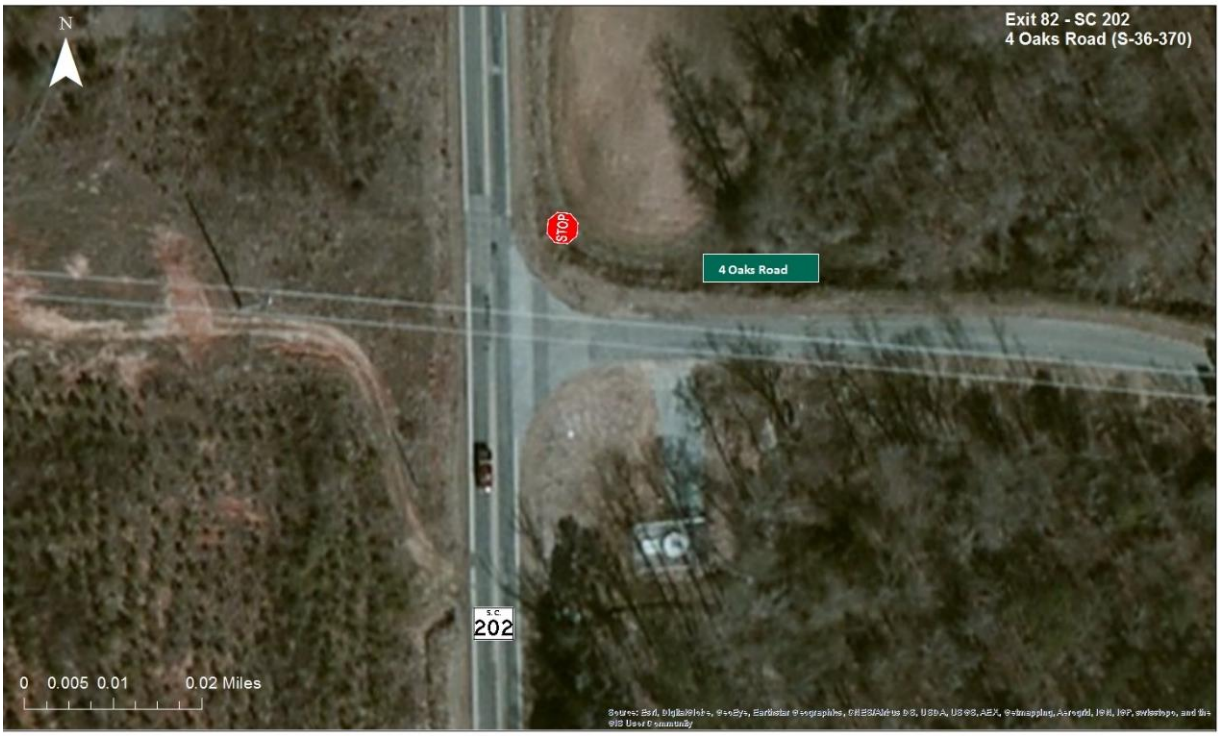
Source: Figure 14, *Interstate 26 Widening Traffic Analysis Report*

Figure 4. Exit 85: SC 202 at Westbound Ramps

Two intersections are located in the vicinity of the interchange. The intersection of SC 202 with Meadow Brook Road (S-36-811) is located about 60 feet north of the westbound on-ramp. The intersection of 4 Oaks Road (S-36-370) is located approximately 520 feet north of the westbound on-ramp.

Meadow Brook Road is a local undivided road without a posted speed limit. Meadow Brook Road is located approximately 60 feet north of the westbound on-ramp intersection, and runs westward and dead-ends in about 1.64 miles. At its intersection with SC 202, the eastbound approach of Meadow Brook Road is controlled by a STOP sign. The existing configuration of the SC 202 intersection with Meadow Brook Road is shown in **Figure 4**.

4 Oaks Road is a local undivided road without a posted speed limit (although at the curves on the roadway, there are posted advisory speed limit signs of 25 and 30 mph). 4 Oaks Road is located approximately 520 feet north of the westbound on-ramp intersection, and runs eastward and dead-ends in 1.51 miles. At its intersection with SC 202, the westbound approach of 4 Oaks Road is controlled by a STOP sign. The existing configuration of SC 202 intersection with 4 Oaks Road is shown in **Figure 5**.



Source: Figure 15, *Interstate 26 Widening Traffic Analysis Report*

Figure 5. Exit 85: SC 202 at 4 Oaks Road

Purpose and Need

The proposed project has two primary purposes: increase roadway capacity to address the projected increased traffic volumes and improve geometric deficiencies along the mainline and at several interchanges and overpasses in this section of I-26 by bringing them into compliance with current state and federal design standards. The secondary purpose is to improve safety, which will be enhanced by improving the geometric design of the facility.

The needs for this project were identified through a comprehensive review of previous studies along with the analysis of current data compiled for this study. This includes information in the I-26 Widening Traffic Analysis Report and the I-26 Accident Analysis Report, as well as information collected through meetings with SCDOT; federal, state and local agencies; project stakeholders, and the public.

Conceptual Design

The SC 202 interchange is expected to be modified as part of the I-26 Widening project. Analyses evaluating 2040 Build conditions for the intersections within the Exit 85 interchange area were initially performed for three alternatives. After the initial analysis, two additional alternatives were developed.

Three alternatives were initially developed for Exit 85.

- Alternative 1 replaces the existing Exit 85 interchange with a full diamond interchange. All intersections would remain STOP-controlled under the 2040 Build conditions. The conceptual design of Alternative 1 is shown in **Figure 6**.
- Alternative 2 replaces the existing Exit 85 interchange with a partial cloverleaf interchange. This alternative would shift two left turn movements to right turn movements, potentially increasing the safety of the ramp termini. The conceptual design of Alternative 2 is shown in **Figure 7**.
- Alternative 3 replaces the existing Exit 85 interchange with a diamond interchange with roundabouts at the ramp termini intersections. The conceptual design of Alternative 3 is shown in **Figure 8**.

As part of the refinement of the original alternatives, Alternative 1A and Alternative 2A were developed.

- In Alternative 1A, the westbound off-ramp in Alternative 1 has been replaced with a westbound loop off-ramp in order to minimize impacts to natural features. The conceptual design of Alternative 1A is shown in **Figure 9**.
- In Alternative 2A, the westbound off-ramp for traffic traveling to the north on SC 202 in Alternative 2 is eliminated. Instead of a westbound directional loop off-ramp for traffic traveling to the south on SC 202, a loop off-ramp that combines both movements to SC 202 is provided. The conceptual design for Alternative 2A is shown in **Figure 10**.

Each Alternative included relocating Meadow Brook Road to increase its distance from the westbound ramp intersection, and most of the alternatives included relocating 4 Oaks Road.

Alternative 1a was selected as the Preferred Alternative because it meets the purpose and need, has the lowest overall construction cost, does not require any residential or commercial relocations, requires the lowest acreage of new right-of-way, and results in the lowest impact to streams making it the least environmentally damaging practicable alternative.

Intersection Modification Report Applicant

The interchange policy is administered by the Federal Highway Administration (FHWA). Therefore, FHWA is required to approve all new access or changes in access points pursuant to this policy.

As the owner and operator of the Interstate System, SCDOT is responsible for submitting a formal request to the FHWA in the form of an IMR that documents the analysis, the rationale for the proposed change in access, and the recommended action.

SCDOT is the sponsoring agency for the I-26 Widening project. The contact information for the I-26 Exit 85 IMR study is provided below:

Assistant Program Manager, Design-Build Group
SC Department of Transportation
955 Park St., Columbia, SC 29201

III. Study Area

In South Carolina, I-26 covers about 221 miles, and provides connections to I-95 south of Providence, to I-77 south of Cayce, to I-20 west of Columbia, and to I-85 north-west of Spartanburg. Within the study area shown on **Figure 1**, I-26 crosses portions of Newberry, Lexington and Richland Counties.

Demographics

According to the 2010 Census, Newberry County has approximately 37,500 residents, Lexington County has approximately 262,500 residents and Richland County has approximately 384,500. The counties have seen a steady increase in population since the 1950's. Between 2000 and 2010, Newberry county saw a 3.7% increase in population, Lexington County saw a 17.7% increase in population and Richland County saw a 16.6% increase in population.

According to the South Carolina Revenue and Fiscal Affairs Office, Newberry County is expected to continue to see gradual population growth between 2010 and 2030,[1] while Lexington County is expected to see more significant population growth by 2030. The same source estimates Richland County's population will continue to grow but possibly at a slower rate than from 2000 to 2010. **Table *1*** presents population growth and projections for the three counties.

Table 1: Population Growth in the I-26 PSA

County	2000 Population	2010 Population	2030 Population	2000 – 2010 % Growth	2010 – 2030 % Growth
Newberry	36,108	37,508	39,800	3.7%	5.6%
Lexington	216,014	262,391	333,200	17.7%	21.3%
Richland	320,677	384,504	456,000	16.6%	15.7%

Land Use

The I-26 Widening project corridor is located primarily within unincorporated areas of Newberry, Lexington, and Richland counties, but includes small portions of the towns of Irmo and Chapin. Existing land uses are primarily forested land and commercial businesses with areas of rural residential and light industrial operations. The closest incorporated municipalities are the City of Columbia to the southeast; the town of Irmo to the southwest; the Town of Chapin to the southwest; the Town of Little Mountain to the south and the Town of Newberry to the northwest.

Along the mainline of I-26, land uses consist mainly of forested land but become increasingly mixed with commercial and residential properties moving from west to east towards Columbia. An industrial park (Chapin Business and Technology Park) and a planned residential/ commercial neighborhood is located southwest of Exit 91. The industrial park has infrastructure and zoning in place but no buildings as of yet. The adjacent residential/ commercial area is in the planning stages.

Property in the study area surrounding Exit 85 – SC 202 is largely undeveloped. Land use appears to be forested and cleared land with no commercial businesses and low density residential parcels further from the interchange. There is potential for increased development at the interchange due to the presence of developable land at each interchange. The interchange improvements would provide interstate access consistent with current design standards that could be attractive for future development.

With anticipated population growth and the corridor's proximity to Columbia, residential, commercial and industrial development are expected to continue within the project study area, for the No-Build and the Preferred Alternative.

Along the mainline of I-26 in the project study area, the land use consists mainly of forested land with areas of commercial, residential, and light industrial uses. The proposed widening of the mainline is not expected to change land uses along the mainline of the interstate.

Transportation System

The Project study area roadway transportation system is part of the I-26 Widening study depicted in **Figure 1**. This region of Lexington, Newberry and Richland counties is accessed via I-26, which is an east-west freeway connecting Columbia with its suburbs in northwest direction.

For this IMR, a focused roadway system was evaluated. It consisted of I-26 mainline with its merge and diverge areas and the Exit 85 - SC 202 interchange. Specifically, I-26 westbound and eastbound mainline segments at Exit 85 – SC 202 were evaluated for traffic conditions during

different hours of the day. This study area is a subset of the broader study area that was analyzed during the Interstate 26 Widening Traffic Analysis Report.

IV. Methodology

Scenarios Analyzed

In March 2017 STV Incorporated prepared the I-26 Widening Traffic Analysis Report that included the following scenarios:

- Existing Conditions
- 2040 No-Build Conditions
- 2040 Build Conditions

Analyses were performed for existing conditions (existing traffic, intersection traffic control and geometry), 2040 No-Build conditions (2040 traffic, and existing intersection traffic control and geometry) and 2040 Build conditions (2040 traffic and modified intersection traffic control and geometry reflecting the reasonable interchange improvement alternative). The Exit 85 alternatives were compared against one another to determine which best met the purpose and need with the least impacts.

The 2040 No-Build Alternative for the Exit 85 interchange represents the existing interchange configuration, intersection traffic control and geometric conditions with no changes to those conditions. Many of the impacts associated with the construction of the interchanges would not occur, but the interchanges would continue to be out of conformance with current state and federal design standards. This would not satisfy the purpose and need for the project.

There were three initial Reasonable Alternatives developed for Exit 85. These alternatives share many common features. They all would meet the purpose and need for the project by bringing the interchange into compliance with current state and federal design requirements. As part of a refinement of the design alternatives, two additional Reasonable Alternatives were developed. These alternatives were revisions to Alternatives 1 and 2 which removed the impacts in the northeast quadrant of the interchange. The safety at the interchange will be improved by providing on and off ramps that separate the interstate traffic from local traffic, and which will be long enough to allow traffic to merge onto the interstate and to store traffic that is exiting the interstate during peak hours. Alternative 1A was recommended as the Preferred Alternative for Exit 85. Alternative 1A combined features of Alternative 1 and Alternative 2. Therefore, the other alternatives were not carried forward in this document and Alternative 1A was analyzed for the 2040 Build Conditions for Exit 85.

The interchanges adjacent to Exit 85 are Exit 82 and Exit 91. Exit 82 – SC 773 is located approximately 3.15 miles northwest of Exit 85. Exit 91 – Columbia Avenue is to the southeast of Exit 85 and is located approximately 5.85 miles away. The interaction of the modifications proposed at Exit 85 with the adjacent interchanges at Exits 82 and 91 were initially analyzed as part of the I-26 Widening Traffic Analysis Report.

By replacing the substandard ramps and modifying the existing interchange to meet current design standards, the proposed modified interchange with SC 202 is anticipated to contribute to an improvement in traffic safety and provide space for the construction of an additional travel lane in each direction along I-26. The proposed improvements should mitigate the existing factors identified in the Accident Analysis as contributing to a high occurrence of rear-end collisions in the area, including short ramps and merge/diverge areas as well as a narrow clear zone at and adjacent to the overpass for SC 202.

The Preferred Alternative of the interchange design also provides space for the construction of an additional travel lane in each direction along I-26. Altogether, these design provisions would enhance the operational efficiency and safety of the corridor, thereby increasing capacity and improving levels of service in the long term.

Traffic Forecasts

A proposed average annual growth rate was estimated based on a comparison of the historic AADT growth rates (for 1996 and 2015) and the South Carolina Statewide Model (SCSWM) average annual growth rates for each of the segments. These proposed growth rates were applied to all mainline, ramp and arterial turning movement volumes within the study area to generate the design year peak hour volumes for use in the alternatives analysis. In setting the growth rate, an annual percentage that is comparable to, but higher than the observed growth rates, is often desirable, so a conservative analysis of future traffic conditions may be attained.

Many of the segments in the study area had estimated growth rates exceeding 1.00 percent per year based on the statewide model. Historic data of all segments exceeded 2.00 percent per year. Given the long term historic growth in the corridor, the growth rate falls in a range from 1.5 percent (based on the model assignments) to 2.5 percent per year (based on the long term growth rate from 1996 – 2015). Based on discussions with SCDOT it was determined that a growth rate of 2.0 percent would be used from US 176 (Broad River Road) to the east of SC 202, and a growth rate of 2.5 percent would be used from SC 202 to the west.

Traffic Analysis

A series of capacity analyses were performed based on the methodologies and guidelines contained in the Transportation Research Board's publication ***HCM 2010 Highway Capacity***

Manual (HCM). Various analysis and simulation software packages based on the HCM were used in performing the analyses. These included:

- McTrans' *HCS 2010* (Version 6.3)
  - Freeway Segments
  - Ramp Merge/Diverge Areas
  - Weaving Segments
- Trafficware's *Synchro* (Version 9.1.910.24)
  - Unsignalized Intersections
  - Signalized Intersections
- Caliper's *TransModeler* (Version 4.0 Build 6020)
  - Network Simulation
  - Freeway Segments
  - Ramp Merge/Diverge Areas

The analysis methodologies contained in the HCM for the various facility types and users describe the operational conditions in terms of a Level of Service (LOS). The HCM defines LOS as

"…a quality measure describing operations conditions within a traffic stream, generally in terms of such service measures as speed and travel time, freedom to maneuver, traffic interruptions, comfort and convenience. Six LOS are defined for each type of facility that has analysis procedures available. Letters designate each level, from A to F, with LOS A representing the best operating conditions and LOS F the worst. Each level of service represents a range of operating conditions and the driver's perception of those conditions. Safety is not included in the measures that establish service levels."

The following discussions and tables describe the HCM LOS criteria for freeway segments, ramp merge/diverge segments, weaving segments, and unsignalized intersections.

Freeway Segments

The HCM characterizes the capacity of a basic freeway segment *"…by three performance measures: density in passenger cars per mile per lane (pc/mi/ln), space mean speed in miles per hour (mi/h), and the ratio of demand flow rate to capacity (v/c). Each of these measures is an indication of how well traffic is being accommodated by the basic freeway segment."*

Table 2 shows the HCM LOS criteria for basic freeway segments. LOS F occurs when either the segment density exceeds 45 pc/mi/ln or when the segment v/c ratio exceeds 1.0 (regardless of the segment density).

Table 2. Freeway Segment LOS Criteria

Basic Freeway Segments	
LOS	Density (pc/mi/ln)
A	< 11
B	> 11-18
C	> 18-26
D	> 26-35
E	> 35-45
F	> 45 v/c > 1.0

Source: Table 12 – *Interstate 26 Widening Traffic Analysis Report*

Weaving Segments

Weaving segments occur where two or more streams of traffic traveling in the same direction are able to cross each other without traffic control devices. This typically occurs where a merge segment is followed by a diverge segment within a relative short distance (usually less than 2,800 feet). The LOS of a weaving segment is also related to the density of the segment. Regardless of the density, the weaving segment is considered to operate at LOS F when the v/c exceeds 1.0. **Table 3** shows the HCM LOS criteria for Freeway Weaving Segments.

Table 3. Weaving Segment LOS Criteria

Freeway Weaving Segments	
LOS	Density (pc/mi/ln)
A	< 10
B	> 10-20
C	> 20-28
D	> 28-35
E	> 35
F	v/c > 1.0

Source: Table 13 – *Interstate 26 Widening Traffic Analysis Report*

Ramp Merge and Diverge Areas

Ramp-freeway junctions occur when merging maneuvers occur (on-ramps) or when diverging maneuvers occur (off-ramps). The operation of these merge and diverge areas are affected by a number of factors, including the operation of the adjacent freeway segment and the proximity and flow on adjacent ramps. Typically, the influence area of the ramps is 1,500 feet upstream of a diverge point and downstream from a merge point. As with freeway segments and weaving segments, the LOS of a merge or diverge area is related to the density of the segment. Regardless of the density, the merge or diverge areas are considered to operate at LOS F when the freeway demand exceeds the capacity of the upstream freeway segment (at diverge areas) or the

downstream freeway segment (at merge areas), as well as when the ramp demand exceeds the ramp capacity. **Table 4** shows the HCM LOS criteria for Ramp Merge and Diverge areas.

Table 4. Merge/Diverge LOS Criteria

Ramp Merge and Diverge Areas	
LOS	Density (pc/mi/ln)
A	< 10
B	> 10-20
C	> 20-28
D	> 28-35
E	> 35
F	v/c > 1.0

Source: Table 14 – *Interstate 26 Widening Traffic Analysis Report*

Unsignalized Intersections

The LOS for unsignalized intersections is based on the average control delay per vehicle. Since major street traffic is seldom controlled by STOP signs (except at intersections with ALL-WAY STOP control or in special circumstances), major street traffic generally will experience virtually no delay. Most of the delay will be encountered by traffic on approaches controlled by STOP signs. Under certain conditions, delay will also be encountered by left turning traffic on the major street waiting for appropriate sized gaps in the opposing traffic flow to complete their turn. Therefore, the delay experienced by STOP controlled movements and major street left turns, rather than the entire average intersection delay, are used to identify the critical LOS at these intersections. **Table 5** shows the HCM LOS criteria for unsignalized intersections.

Table 5. Unsignalized Intersection LOS Criteria

Unsignalized Intersections	
LOS	Control Delay (sec/vehicle)
A	< 10
B	> 10-15
C	> 15-25
D	> 25-35
E	> 35-50
F	> 50

Source: Table 15 – *Interstate 26 Widening Traffic Analysis Report*

V. Traffic Volumes

The traffic volumes used in the analysis for Exit 85 consisted of Existing (2016) conditions, and Future (2040) No-Build and Build conditions.

Existing 2016 Traffic Volumes

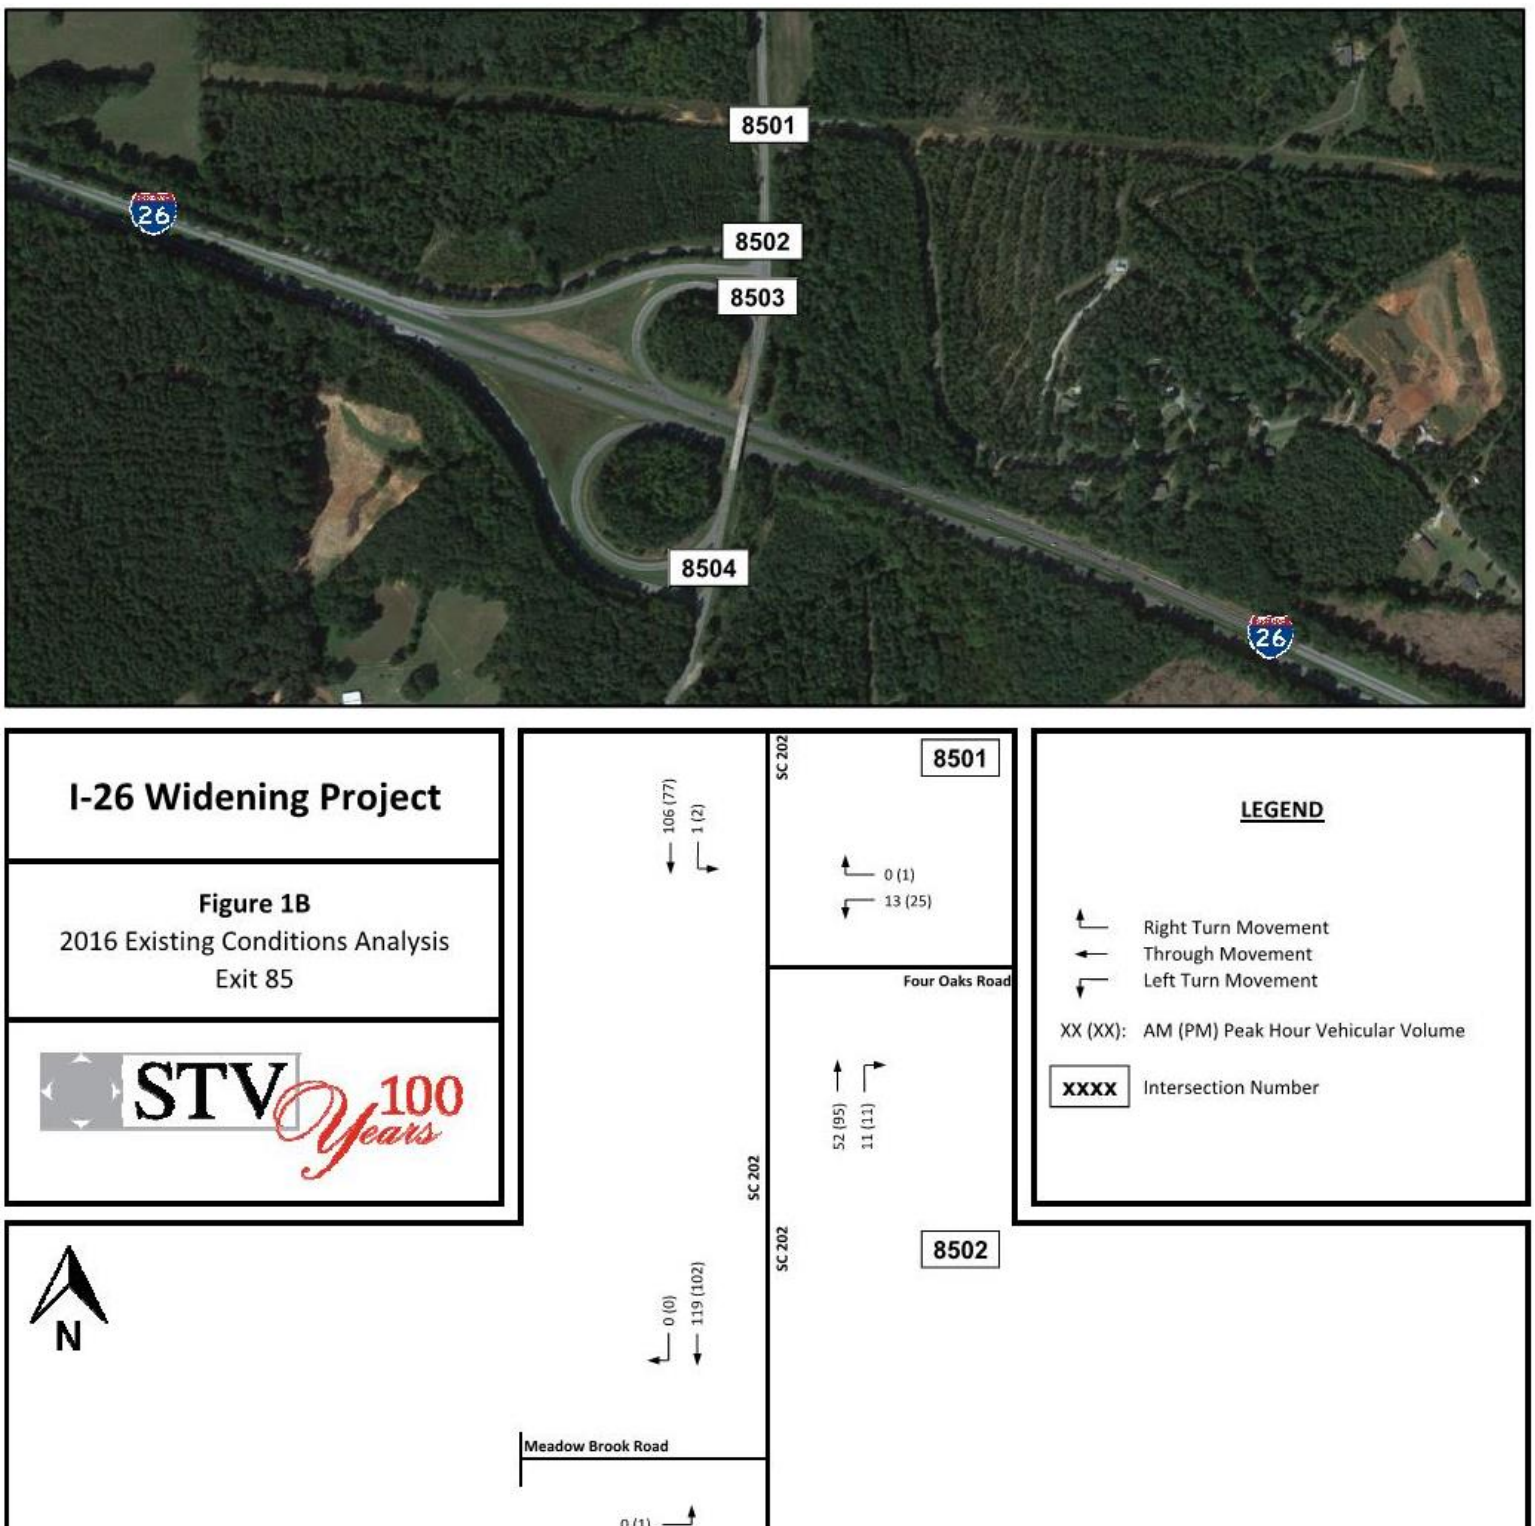
Turning movement traffic count data were obtained for a number of ramp termini and other adjacent intersections within the Exit 85 interchange area from 7:00 to 9:00 AM and from 4:00 to 6:00 PM on Tuesday, August 23, 2016. The turning movement count data, which are provided in **Appendix A**, included:

- SC 202 & S-36-811 (Meadow Brook Road)
- SC 202 & S-36-370 (Four Oaks Road)

Turning movement counts conducted for 12 hours between 7:00 AM and 7:00 PM on Tuesday, August 23, 2016 at the following locations:

- SC 202 & I-26 westbound ramps
- SC 202 & I-26 eastbound ramps

The turning movement traffic count data were evaluated and reviewed. The morning and afternoon peak hour volumes at each of the ramp termini and the adjacent intersections at each interchange were identified and were balanced between intersections. The balanced morning and afternoon peak hour volumes for the interchange are shown in **Figure 11**.



Source: Figure 58, *Interstate 26 Widening Traffic Analysis Report*
Figure 11. Existing Peak Hour Turning Movement Volumes

2040 Traffic Volumes

Turning movement volumes for the 2040 design year at Exit 85 were derived by applying the 2.5 percent annual growth rate to the existing turning movement volumes at the various intersections. The 2040 estimated peak hour turning movement volumes shown on the existing (No-Build) network are presented in **Figure 12** and on the Preferred Alternative 1A in **Figure 13**.

VI. Traffic Operations

Freeway and Ramp Merge/Diverge Segment Analysis

The analysis of basic freeway segments within the study area were performed for existing conditions, future (2040) No-Build conditions and future (2040) Build conditions. The following criteria were identified through discussions with SCDOT and used for various inputs within the freeway segment analysis:

- The 10th highest hour volumes based on the P-0112 ATR count station data for the eastbound AM design hour, and the P-0015 ATR count station data for the eastbound PM and westbound AM and PM design hours, balanced through the system, were used for the freeway segment mainline volumes.
- To develop future (2040) traffic volumes, a growth rate of 2.0 percent was applied to existing volumes from US 176 (Broad River Road) to the east of SC 202, and a growth rate of 2.5 percent was applied to existing volumes from SC 202 to the west.
- A peak hour factor of 0.90 was used for freeway segments and ramp areas.
- Mainline vehicle classification counts were completed in both directions east of Exit 101 and west of Exit 85. The highest observed peak hour truck percentages at the vehicle classification counts for all of the segments in each direction/peak hour were used. The highest observed truck percentages all ended up being the truck percentages observed west of Exit 85. The proportion of trucks and buses traveling on the freeway segments and ramp movements, based on SCDOT data, is:
    - Eastbound AM – 16%
    - Eastbound PM – 14%
    - Westbound AM – 23%
    - Westbound PM – 13%
- Based on the grades through the study area, the terrain was selected as “Rolling” instead of “Level” or “Mountainous”.
- Free-flow speed was set at the posted speed limit along the segment.

The existing conditions and 2040 No-Build conditions analyses were performed using the existing number of freeway lanes present on the segments within the study area. The 2040 Build

conditions analyses were performed assuming I-26 would provide three lanes in each direction. The Basic Freeway Segment Analysis outputs are provided in **Appendix B** and a summary of results is shown in **Table 6.** The results of the ramp merge and diverge analyses for Exit 85 are shown in **Table 7** and **Table 8,** respectively.

Table 8 - Ramp Diverge Capacity Analysis Results

Freeway Diverge Analysis Results													
Direction	Diverge Location	AM Peak Hour						PM Peak Hour					
		2016 Existing		2040 No-Build		2040 Build		2016 Existing		2040 No-Build		2040 Build	
		LOS	Density	LOS	Density	LOS	Density	LOS	Density	LOS	Density	LOS	Density
WB	Exit 85	B	14.9	B	17.8	B	13.0	C	23.5	D	31.8	C	21.8
EB	Exit 85	B	16.2	C	26.8	C	20.5	B	23.7	D	31.7	C	23.5

The analysis results for the freeway segments in the westbound and in the eastbound direction between Exit 82 and Exit 91 for the 2016 Existing Conditions that are summarized in **Table 6**, indicate the following:

- During the morning peak hour, the freeway segments operate at LOS B;
- During the afternoon peak hour, the freeway segments operate at LOS C.

With traffic volumes projected to increase in the vicinity of Exit 85 at an annual rate of between 2.0 and 2.5 percent per year, and if I-26 is not widened, the increased traffic volumes traveling on the existing interstate capacity will result in increased density and reductions of freeway segment LOS.

- During the 2040 No-Build morning peak hour, the eastbound segment between Exit 85 and 91 is expected to operate at LOS D. The remaining segments will operate at LOS C or better;
- During the 2040 No-Build afternoon peak hour, all of the freeway segments are expected to operate at LOS D.

The additional capacity provided by the construction of an additional, third lane on I-26 through the Exit 85 area will result in generally comparable LOS in the morning and afternoon peak hours compared to the Existing Conditions, and improved LOS over the 2040 No-Build condition. The 2040 Build analysis results indicate that:

- During the morning peak hour, all freeway segments operate at LOS C or better;
- During the afternoon peak hour, the two lane freeway segments west of Exit 85 operate at LOS D. The three lane freeway segments east of Exit 85 operate at LOS B.

The Ramp Merge Analyses outputs are provided in **Appendix C** and the summary results are shown in **Table 7**. The analysis results for the ramp merge areas, indicate the following:

Using the design hour volumes for the morning and afternoon peak hours, the analysis results for the 2016 Existing Conditions indicate that:

- During the morning peak hour, the Exit 85 merge areas operate at LOS B;
- During the afternoon peak hour, the Exit 85 merge areas operate at LOS C.

With traffic volumes projected to increase on the merge areas at Exit 85 at an annual rate of between 2.0 and 2.5 percent per year and if I-26 is not widened, the increased traffic volumes traveling on the existing merge ramps capacity will result in increased density and will reduce the LOS of the merge areas.

- During the morning peak hour, the Exit 85 merge areas operate at LOS D or better;
- During the afternoon peak hour, the Exit 85 merge areas operate at LOS D.

The additional capacity provided by the construction of a third lane in each direction along I-26 in the westbound and eastbound directions from Exit 82 to Exit 91 will lower densities in the ramp diverge areas, thus, it will result in comparable LOS in the morning and afternoon peak hours compared to the Existing Conditions and improved LOS over the 2040 No-Build condition, especially during the afternoon peak hour. The 2040 Build analysis results indicate that:

- During the morning peak hour, the Exit 85 merge areas operate at LOS B;
- During the afternoon peak hour, the Exit 85 merge areas operate at LOS B.

The Ramp Diverge Analyses are also provided in **Appendix C** and the summary results are shown in **Table 8**.

The analysis results for the ramp diverge areas, indicate the following:

Using the design hour volumes for the morning and afternoon peak hours, the analysis results for 2016 Existing Conditions indicate that:

- During the morning peak hour, the Exit 85 diverge areas operate at LOS B;
- During the afternoon peak hour, the Exit 85 diverge areas operate at LOS C or better.

With traffic volumes projected to increase adjacent to Exit 85 at an annual rate of between 2.0 and 2.5 percent per year and if I-26 is not widened, the increased traffic volumes traveling on the existing diverge ramps capacity will result in increased density and will reduce the diverge area LOS at the off-ramps.

- During the morning peak hour, the Exit 85 diverge areas operate at LOS C or better;
- During the afternoon peak hour, the Exit 85 diverge areas operate at LOS D.

The additional capacity provided by the construction of a third lane in each direction along I-26 will lower densities in the ramp diverge areas, resulting in substantial improvement in LOS compared to the 2040 No-Build condition, with LOS comparable to those experienced under 2016 Existing conditions. The 2040 Build analysis results indicate that:

- During the morning peak hour, the Exit 85 diverge areas operate at LOS C or better;
- During the afternoon peak hour, the Exit 85 diverge areas operate at LOS C.

Existing and 2040 No Build Intersection Analysis

Capacity analyses for the unsignalized intersections at the interchanges within the study area were performed. Analyses were performed for existing conditions (existing traffic, intersection traffic control and geometry), 2040 No-Build conditions (2040 traffic, and existing intersection traffic control and geometry), and 2040 Build conditions (2040 traffic and modified intersection traffic control and geometry).

For unsignalized intersections, the intersection operation is represented by the worst approach delay and LOS of all the STOP sign controlled approaches to the intersection.

The results of the unsignalized intersection capacity analyses for existing conditions and the 2040 No-Build conditions are shown in **Table 9** and **Figure 14**. The HCM intersection capacity outputs for each intersection are provided in **Appendix D**.

Under existing conditions, the STOP sign controlled approaches at the unsignalized intersections along SC 202 at Exit 85 operate at LOS A or B for the morning and afternoon peak hours. *No improvements are necessary to provide acceptable LOS under existing conditions.*

In general, with the forecast increases in traffic and without improvements to the intersections, delay in the 2040 No-Build analyses can be expected to be higher than delay during the Existing Conditions analyses. However, the approaches are expected to continue to operate at LOS B or better during the morning and afternoon peak hours.

No improvements should be necessary to provide acceptable LOS during the 2040 No-Build operating conditions at these intersections.

2040 Build Intersection Analysis – Preferred Alternative 1A

The SC 202 interchange is expected to be modified as part of the I-26 Widening project. In the Interstate 26 Widening Report, Alternative 1A, which replaces the existing interchange with a Diamond interchange with a loop ramp in the northeast quadrant, was chosen as the Preferred Alternative.

Other elements of the alternative concept include:

- Relocating the intersection of Meadow Brook Road and SC 202 to provide greater separation from the westbound ramps.
- Realigning Meadow Brook Road.
- Upgraded acceleration/deceleration lanes on I-26
    - Eastbound on-ramp: 1300’ (1600’ including the taper)
    - Eastbound off-ramp: 220’ taper
    - Westbound on-ramp: 780’ (1080’ including the taper)
    - Westbound off-ramp: 895’ (1195’ including the taper)

Capacity analysis for the unsignalized intersections of the Preferred Alternative were performed for the 2040 Final Build conditions which included the 2040 traffic volumes and the Preferred Alternative geometry at the Exit 85 interchange.

For the Preferred Alternative, all intersections operate at LOS A or LOS B. The Preferred Alternative did not require any traffic control improvements to provide an acceptable LOS.

The results of the unsignalized intersection capacity analyses for the 2040 Build Preferred Alternative 1A are shown in **Table 10** and **Figure 15**. Queuing results for the 2040 No-Build and Build conditions are shown in **Table 11**.

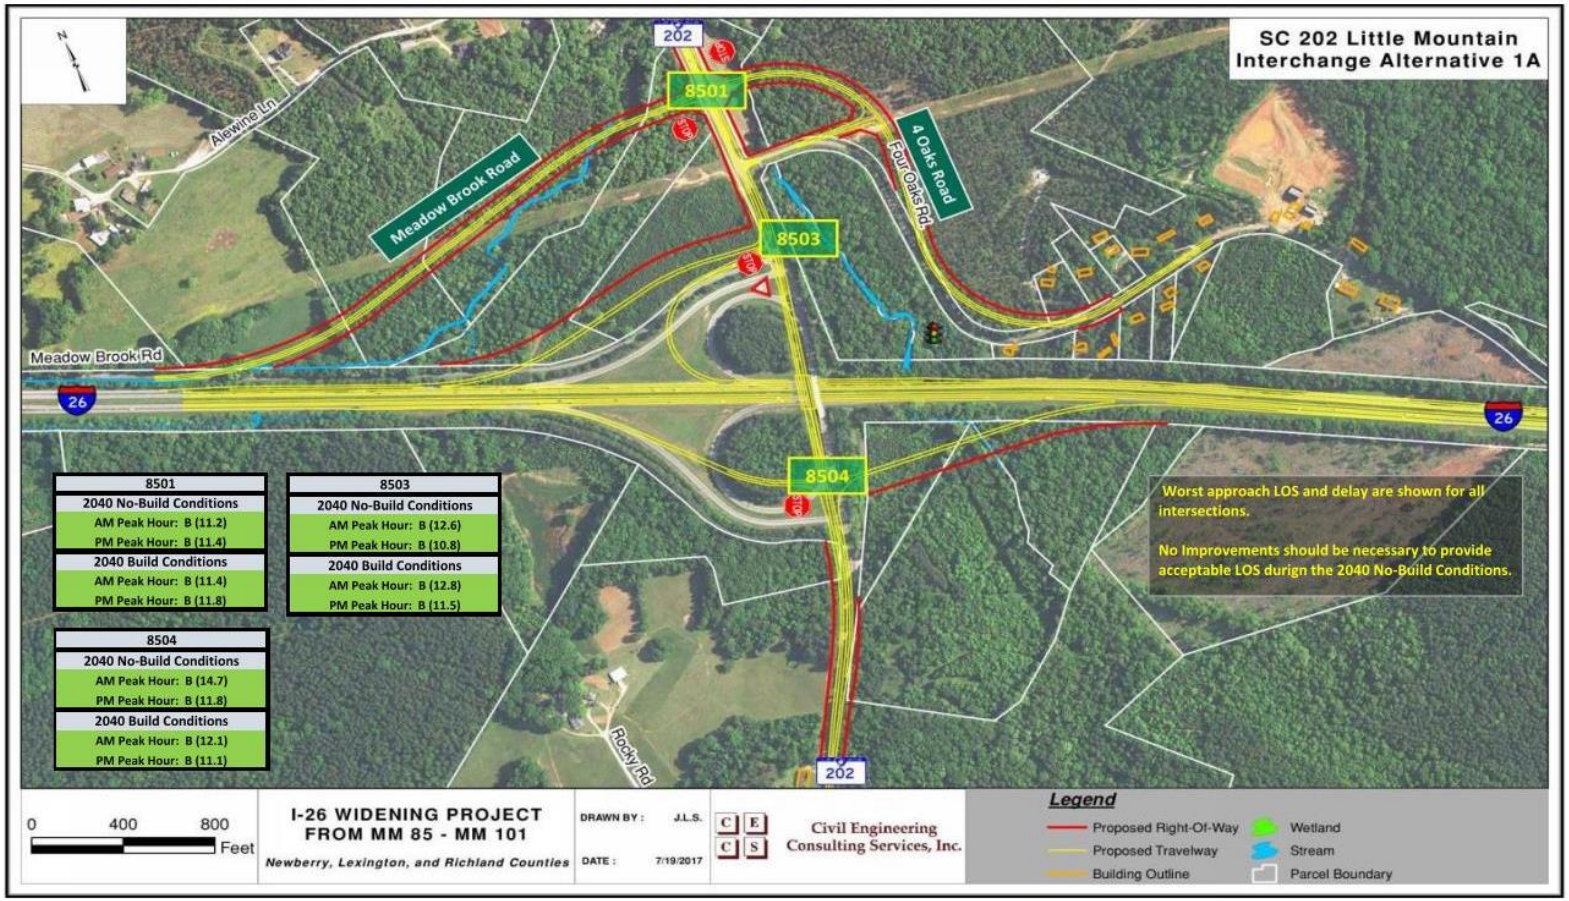

Figure 15. Exit 85 – SC 202 Interchange Intersection LOS Summary Preferred Alternative 1A

TransModeler Network Analysis

TransModeler, a microsimulation software, was used to analyze the Existing, No-Build, and Build alternative freeway networks. A TransModeler microsimulation model consists of a large amount of component database and executable files that are run through the TransModeler software. The model then is initiated within TransModeler through a single project file. The main components of the model are network files, traffic control and signal timing plans, vehicle detector layout and configuration, trip tables for both autos and trucks, traffic counts, and parameter files. This section illustrates how to develop these main components for creating a base year model of existing conditions. The microsimulation model was developed for the 20-mile interstate section of the project and was based on a calibrated base model for the area.

There are several limitations of using HCS, which is a macroscopic, deterministic model that uses HCM methodologies. The HCS analysis may show differing conditions than existing operations and conditions in the field because it does not consider upstream and downstream traffic impacts and is unable to model interactions between the two. The HCS model is a spot check at a certain location; therefore upstream and downstream operations are not taken into consideration and have no effect on the analyses. This is not the case for actual conditions, as upstream or downstream congestion may have direct impacts at a specific segment causing a ripple effect. TransModeler evaluates each segment and lane by taking into consideration vehicle interaction and driver behaviors, as well as the operational impacts for both the upstream and downstream traffic conditions.

The existing conditions and 2040 No-Build conditions TransModeler analysis was performed using the existing number of freeway lanes present on the segments within the study area, similar to the HCS analysis. Therefore, the same TransModeler simulation network was used for existing and No-Build conditions. The only difference between the existing and No-Build conditions is the input trip table volumes and a proposed widening project along Broad River Road. The 2040 No-Build conditions volumes were developed using the growth rates determined based on discussions with SCDOT. It was determined that a growth rate of 1.5 percent would be used from the east end of the study area to east of US 176 (Broad River Road), 2.0 percent would be used from US 176 (Broad River Road) to the east of SC 202, and a growth rate of 2.5 percent would be used from SC 202 to the west. The existing truck percentages for the model were developed utilizing classification counts along the mainline along with intersection counts along the arterials. These inputs were combined to develop an Origin-Destination (OD) matrix for both medium and heavy trucks. These truck volumes were then scaled up to 2040 volumes by the same proportions as the overall volume growth.

The 2040 Build AM and PM TransModeler models for the 20-mile study area of I-26 were developed by modifying the 2040 No-Build models to incorporate the widening of I-26 in each direction as well as the Preferred Alternatives for each interchange. Synchro was used to input the recommended traffic signal timing information into the network for the arterial intersections.

Each simulation was run for one hour with 30 minutes of seeding time to load the network. 10 repetitions were used for both the AM and PM peak periods.

The Basic Freeway Segment Analysis outputs for the existing conditions, 2040 No-Build conditions, and the Preferred Alternative 1A Build conditions are provided in **Appendix E** and a summary of results is shown in **Table 12**.

The widening of I-26 extends to Exit 85 to accommodate the projected increase in traffic volume within the corridor. This widening will result in segment densities adjacent to Exit 85 in the 2040 Build condition being comparable to those in existing conditions.

The analysis results for the freeway segment analysis for the Existing Conditions, summarized in **Table 12**, indicate the following:

- During the morning peak hour, all freeway segments operate at LOS B or better.
- During the afternoon peak hour, all freeway segments operate at LOS C or better.

With traffic volumes projected to increase within the corridor at an annual rate of 2.0 to 2.5 percent per year and if I-26 is not widened, the increased volumes traveling on the existing interstate during the 2040 No-Build conditions will result in increased density and reductions of freeway segment LOS. However, due to unprocessed volume from upstream queuing, the No-Build conditions may appear better than the Existing conditions in some locations.

- During the 2040 No-Build morning peak hour, the eastbound segment from Exit 85 to 91 is expected to operate at LOS F. All other segments are expected to operate at LOS C or better.
- During the 2040 No-Build afternoon peak hour, the eastbound segment from Exit 85 to 91 is expected to operate at LOS F. All other segments are expected to operate at LOS C or better.

The additional capacity provided by the construction of a third lane in each direction along I-26 will result in substantial improvement in LOS compared to the 2040 No-Build condition, with LOS comparable to those experienced under existing conditions. The 2040 Build analysis results indicate that:

- During the morning peak hour, all freeway segments operate at LOS C or better.
- During the afternoon peak hour, all freeway segments operate at LOS C or better.

[2] Density expressed as passanger cars/per mile/per lane.

The summary of the Ramp Merge Analyses results for the Build condition, compared to the Existing and No-Build conditions, is shown in **Table 13**. The outputs for the Build conditions analyses are provided in **Appendix F**.

The widening of I-26 to three lanes to the west side of Exit 85 will result in the Exit 85 merge areas in the 2040 Build condition having densities comparable to those in existing conditions.

The analysis results for the ramp merge areas, summarized in **Table 13**, indicate the following:

Using the design hour volumes for the morning and afternoon peak hours, the analysis results for the Existing conditions indicate that:

- During the morning peak hour, the Exit 85 eastbound and westbound ramp merge areas operate at LOS B
- During the afternoon peak hour, the Exit 85 eastbound and westbound ramp merge areas operate at LOS C or better

With traffic volumes projected to increase within the corridor for 2040 No-Build conditions and if I-26 is not widened, the increased traffic volumes traveling on the existing interstate capacity will result in increased density and could reduce the merge area LOS. However, due to unprocessed volume from upstream queuing, the No-Build conditions may appear better than the Existing conditions in some locations.

- During the 2040 No-Build morning peak hour, the eastbound ramp merge at Exit 85 is expected to operate at LOS D. The westbound ramp merge at Exit 85 is expected to operate at LOS A.
- During the 2040 No-Build afternoon peak hour, the eastbound ramp merge at Exit 85 is expected to operate at LOS D. The westbound ramp merge at Exit 85 is expected to operate at LOS B.

The additional capacity provided by the construction of a third lane in each direction along I-26 will result in improvement in LOS compared to the 2040 No-Build condition, with LOS comparable to those experienced under existing conditions. The 2040 Build analysis results indicate that:

- During the morning peak hour, the Exit 85 eastbound and westbound ramp merge areas operate at LOS B or better.
- During the afternoon peak hour, the Exit 85 eastbound and westbound ramp merge areas operate at LOS B.

The summary of the Ramp Diverge Analyses results for the Build conditions, compared to the Existing and No-Build conditions, are shown in **Table 14**. The outputs for the Build conditions analyses are also provided in **Appendix F**.

The widening of I-26 to three lanes to the west side of Exit 85 will result in the Exit 85 diverge areas in the 2040 Build condition having densities comparable to those in existing conditions.

The analysis results for the ramp diverge areas, summarized in **Table 14**, indicate the following:

Using the design hour volumes for the morning and afternoon peak hours, the analysis results for the Existing conditions indicate that:

- During the morning peak hour, the Exit 85 eastbound and westbound ramp diverge areas operate at LOS B.
- During the afternoon peak hour, the Exit 85 eastbound and westbound ramp diverge areas operate at LOS C or better.

With traffic volumes projected to increase within the corridor for 2040 No-Build conditions and if I-26 is not widened, the increased traffic volumes traveling on the existing interstate capacity will result in increased density and could reduce the LOS at the diverge areas. However, due to unprocessed volume from upstream queuing, the No-Build conditions may appear better than the Existing conditions in some locations.

- During the morning peak hour, the Exit 85 eastbound and westbound ramp diverge areas operate at LOS B
- During the afternoon peak hour, the Exit 85 eastbound and westbound ramp diverge areas operate at LOS C or better

The additional capacity provided by the construction of a third lane in each direction along I-26 will result in improvement in LOS compared to the 2040 No-Build condition, with LOS comparable to those experienced under existing conditions. The 2040 Build analysis results indicate that:

- During the morning peak hour, the Exit 85 eastbound and westbound ramp diverge areas operate at LOS C or better.
- During the afternoon peak hour, the Exit 85 eastbound and westbound ramp diverge areas operate at LOS D and LOS B, respectively.

VII. Interchange Justification

A policy statement for justifying the need for additional or modified access to the existing sections of an Interstate System was first published in the Federal Register on October 22, 1990 entitled "Access to the Interstate System". It was then modified and updated on February 11, 1998, on August 27, 2009 and on May 22, 2017. The objectives of this policy are to ensure that all new or revised access points do not adversely impact the operations and safety of the Interstate System, and all new or revised access points have been vetted through a systematic evaluation process.

In order to explain the intent and requirements of this new policy, U. S. Department of Transportation Federal Highway Administration published a Memorandum on May 22, 2017. This FHWA Guide was followed in preparing the current Interchange Modification Report (IMR) for the I-26/Exit 85 Interchange in Newberry County, South Carolina.

Policy Point 1

An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (23 CFR 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

The intent of the Policy Point 1 is to require detailed operational and safety analysis of the relevant interstate segments and provide a comparison of the No-Build and Build conditions that are anticipated to occur through the design year of the project.

The analysis of the interstate facility and Exit 85 is an extension of the previous project-wide traffic operations and safety analysis as summarized in the *I-26 Widening Traffic Analysis Report* and the *I-26 Widening Project MM 85 – MM 101 Traffic Safety Analysis Report*.

The analysis of the interstate facility includes the portion of I-26 between SC 773 interchange (Exit 82) and the Columbia Avenue (S-32-48) interchange (Exit 91), including the proposed modification of SC 202 interchange (Exit 85). The analysis was performed using methodologies and procedures outlined in the Transportation Research Board's *Highway Capacity Manual* and used the HCS-2010 analysis and TransModeler simulation model software.

The analysis of the 2040 Build conditions of the Preferred Alternative (Alternative 1A) illustrates that the project would not have any significant negative impact on the safety and on the operation of the facilities within the project area. The analysis shows Interstate 26 mainline operations and ramp merge/diverge areas are estimated to operate at LOS D or better during the 2040 morning and afternoon peak hours. Without the proposed improvement, the freeway segments and ramp merge/diverge areas would operate between LOS A to LOS F during the 2040 No-Build morning peak hour, and between LOS B to LOS F during the 2040 No-Build afternoon peak hour.

Exit 82, the interchange adjacent to Exit 85, is not expected to be modified as part of the I-26 Widening project. Exit 91 (Columbia Avenue) is expected to be modified to provide a Diverging Diamond Interchange. The DDI concept was evaluated and selected as the Preferred Alternative in the *Interchange Modification Report, I-26 at S-48 (Columbia Avenue) Interchange Improvements*.

Exit 82 - SC 773 is located approximately 3.15 miles northwest of the Exit 85 interchange. Exit 91 - Columbia Avenue (S-32-48) is located approximately 5.85 miles southeast of the Exit 85 interchange. With interchange spacing exceeding 3 miles to the next adjacent interchange from Exit 85, there are no anticipated operational concerns related to the spacing between interchanges. Sufficient distance exists between upstream and downstream merging/diverging areas at the adjacent interchanges to eliminate the influence of traffic movements within these areas, and analysis shows the freeway segments are projected to operate at LOS D or better.

The Accident Analysis Report identifies rear end collisions and no collision with motor vehicle as the most frequent types of crashes within the study area. The report also identifies driving too fast for conditions as the main cause of rear end crashes. The presence of median barriers and guardrail fences are noted as the first harmful event for no collision with motor vehicle crashes. The Accident Analysis Report points out that the geometric conditions resulting from merge/diverge areas of loop ramps seem to play a role in the frequency of the crashes and that merging distance at on-ramps and diverging distances at off-ramps should be improved to SCDOT standards where these standards are not already met. Study area hot spots along the interchange arterials include frequent crashes at Exit 91 along Columbia Avenue at business driveways to the

west of the eastbound off-ramp intersection. It is anticipated that access controls implemented as part of the proposed Exit 91 DDI interchange improvement will address these concerns.

Modifying interchanges to eliminate loop ramps at Exit 85 may also reduce crashes on the segments adjacent to the loop ramps. By replacing the substandard ramps and modifying the existing interchange to meet current design standards, the proposed interchanges with SC 202 and with Columbia Avenue are anticipated to contribute to an improvement in traffic safety.

The Preferred Alternative (Alternative 1A) of the interchange design also provides space for the construction of an additional travel lane in each direction along I-26. Altogether, these design provisions would enhance the operational efficiency and safety of the corridor, thereby increasing capacity and improving levels of service in the long term.

Pedestrian facilities are not incorporated into the design due to the rural nature of the interchange area.

A conceptual signing plan is included in **Appendix G**.

Policy Point 2

The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit, HOVs, HOT lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.

The intent of the Policy Point 2 is to require implementation of an interchange design for the new access that allows for all relevant movements for general purpose traffic, whenever feasible.

The existing SC 202 interchange is a partial cloverleaf interchange that provides for all traffic movements. Because of its unconventional orientation, all ramps are located on the west side of the interchange. Spacing between the existing ramps are short. In addition, two-way Meadow Brook Road runs parallel to the westbound on-ramp and ties in SC 202 70 feet north of westbound on-ramp and SC 202 intersection.

As illustrated in the design concept for the Preferred Alternative, the proposed modification of Exit 85 would continue to provide full access for all traffic movements. It would shift ramp movements away from the two-way frontage roads directly to intersections with SC 202, and provide ramps that meet or exceed current design standards, improving access to SC 202 and the surrounding roadway network.

Operational Analysis

Analyst:	RJD
Agency or Company:	STV Incorporated
Date Performed:	03/08/2017
Analysis Time Period:	AM Peak
Freeway/Direction:	I-26 SB
From/To:	EB02 Segment Exit 82-85
Jurisdiction:	Newberry County
Analysis Year:	2016
Description:	I-26 mm 85-101

Flow Inputs and Adjustments

Volume, V	1283	veh/h
Peak-hour factor, PHF	0.88	
Peak 15-min volume, v15	364	v
Trucks and buses	16	%
Recreational vehicles	0	%
Terrain type:	Rolling	
Grade	-	%
Segment length	-	mi
Trucks and buses PCE, ET	2.5	
Recreational vehicle PCE, ER	2.0	
Heavy vehicle adjustment, fHV	0.806	
Driver population factor, fp	1.00	
Flow rate, vp	904	pc/h/ln

Speed Inputs and Adjustments

Lane width	-	ft
Right-side lateral clearance	-	ft
Total ramp density, TRD	-	ramps/mi
Number of lanes, N	2	
Free-flow speed:	Measured	
FFS or BFFS	70.0	mi/h
Lane width adjustment, fLW	-	mi/h
Lateral clearance adjustment, fLC	-	mi/h
TRD adjustment	-	mi/h
Free-flow speed, FFS	70.0	mi/h

LOS and Performance Measures

Flow rate, vp	904	pc/h/ln
Free-flow speed, FFS	70.0	mi/h
Average passenger-car speed, S	70.0	mi/h
Number of lanes, N	2	
Density, D	12.9	pc/mi/ln
Level of service, LOS	B	

Overall results are not computed when free-flow speed is less than 55 mph.

Estimation of V12 Diverge Areas

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 1.000 Using Equation 0

$v_{12} = v_R + (v_F - v_R) P_{FD}$ = 4255 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
$v_{Fi} = v_F$	4255	4800	No
$v_{FO} = v_F - v_R$	3919	4800	No
v_R	336	2100	No
v_3 or v_{av34}	0 pc/h	(Equation 13-14 or 13-17)	

Is v_3 or v_{av34} > 2700 pc/h? No

Is v_3 or v_{av34} > 1.5 v_{12}/2 No

If yes, v_{12A} = 4255 (Equation 13-15, 13-16, 13-18, or 13-19)

Flow Entering Diverge Influence Area

	Actual	Max Desirable	Violation?
v_{12}	4255	4400	No

Level of Service Determination (if not F)

Density, $D_R = 4.252 + 0.0086\ v_{12} - 0.009\ L_D$ = 31.9 pc/mi/ln

Level of service for ramp-freeway junction areas of influence D

Speed Estimation

Intermediate speed variable, D_S = 0.393

Space mean speed in ramp influence area, S_R = 59.0 mph

Space mean speed in outer lanes, S_O = N/A mph

Space mean speed for all vehicles, S = 59.0 mph

Estimation of V12 Diverge Areas

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 1.000 Using Equation 0

$v_{12} = v_R + (v_F - v_R) P_{FD}$ = 3510 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
$v_{Fi} = v_F$	3510	4800	No
$v_{FO} = v_F - v_R$	1714	4800	No
v_R	1796	2100	No
v_3 or v_{av34}	0 pc/h	(Equation 13-14 or 13-17)	

Is v_3 or v_{av34} > 2700 pc/h? No

Is v_3 or v_{av34} > 1.5 v_{12}/2 No

If yes, v_{12A} = 3510 (Equation 13-15, 13-16, 13-18, or 13-19)

Flow Entering Diverge Influence Area

	Actual	Max Desirable	Violation?
v_{12}	3510	4400	No

Level of Service Determination (if not F)

Density, $D_R = 4.252 + 0.0086\ v_{12} - 0.009\ L_D$ = 24.1 pc/mi/ln

Level of service for ramp-freeway junction areas of influence C

Speed Estimation

Intermediate speed variable, D_S = 0.525

Space mean speed in ramp influence area, S_R = 55.3 mph

Space mean speed in outer lanes, S_O = N/A mph

Space mean speed for all vehicles, S = 55.3 mph

Analysis Year:	2040 Build
Description:	I-26 mm 85-101

Freeway Data

Type of analysis	Diverge	
Number of lanes in freeway	3	
Free-flow speed on freeway	70.0	mph
Volume on freeway	2158	vph

Off Ramp Data

Side of freeway	Right	
Number of lanes in ramp	1	
Free-Flow speed on ramp	40.0	mph
Volume on ramp	99	vph
Length of first accel/decel lane	405	ft
Length of second accel/decel lane		ft

Adjacent Ramp Data (if one exists)

Does adjacent ramp exist?	Yes	
Volume on adjacent ramp	416	vph
Position of adjacent ramp	Downstream	
Type of adjacent ramp	On	
Distance to adjacent ramp	1050	ft

Conversion to pc/h Under Base Conditions

Junction Components	Freeway		Ramp		Adjacent Ramp		
Volume, V (vph)	2158		99		416		vph
Peak-hour factor, PHF	0.88		0.83		0.86		
Peak 15-min volume, v15	613		30		121		v
Trucks and buses	16		22		7		%
Recreational vehicles	0		0		0		%
Terrain type:	Rolling		Rolling		Rolling		
Grade	0.00	%	0.00	%	0.00	%	
Length	0.00	mi	0.00	mi	0.00	mi	
Trucks and buses PCE, ET	2.5		2.5		2.5		
Recreational vehicle PCE, ER	2.0		2.0		2.0		
Heavy vehicle adjustment, fHV	0.806		0.752		0.905		
Driver population factor, fP	1.00		1.00		1.00		

Flow rate, vp 3041 159 535 pcph

Estimation of V12 Diverge Areas

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.677 Using Equation 9

$v_{12} = v_R + (v_F - v_R) P_{FD}$ = 2109 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
$v_{Fi} = v_F$	3041	7200	No
$v_{FO} = v_F - v_R$	2882	7200	No
v_R	159	2100	No
v_3 or v_{av34}	932 pc/h	(Equation 13-14 or 13-17)	

Is v_3 or v_{av34} > 2700 pc/h? No

Is v_3 or v_{av34} > 1.5 v_{12}/2 No

If yes, v_{12A} = 2109 (Equation 13-15, 13-16, 13-18, or 13-19)

Flow Entering Diverge Influence Area

	Actual	Max Desirable	Violation?
v_{12}	2109	4400	No

Level of Service Determination (if not F)

Density, $D_R = 4.252 + 0.0086\ v_{12} - 0.009\ L_D$ = 18.7 pc/mi/ln

Level of service for ramp-freeway junction areas of influence B

Speed Estimation

Intermediate speed variable, D_S = 0.377

Space mean speed in ramp influence area, S_R = 59.4 mph

Space mean speed in outer lanes, S_O = 76.8 mph

Space mean speed for all vehicles, S = 63.9 mph

Number of lanes in freeway	3	
Free-flow speed on freeway	70.0	mph
Volume on freeway	3200	vph

Off Ramp Data

Side of freeway	Right	
Number of lanes in ramp	1	
Free-Flow speed on ramp	40.0	mph
Volume on ramp	230	vph
Length of first accel/decel lane	995	ft
Length of second accel/decel lane		ft

Adjacent Ramp Data (if one exists)

Does adjacent ramp exist?	Yes	
Volume on adjacent ramp	81	vph
Position of adjacent ramp	Upstream	
Type of adjacent ramp	On	
Distance to adjacent ramp	9999	ft

Conversion to pc/h Under Base Conditions

Junction Components	Freeway		Ramp		Adjacent Ramp		
Volume, V (vph)	3200		230		81		vph
Peak-hour factor, PHF	0.91		0.85		0.66		
Peak 15-min volume, v15	879		68		31		v
Trucks and buses	14		16		10		%
Recreational vehicles	0		0		0		%
Terrain type:	Rolling		Rolling		Rolling		
Grade	0.00	%	0.00	%	0.00	%	
Length	0.00	mi	0.00	mi	0.00	mi	
Trucks and buses PCE, ET	2.5		2.5		2.5		
Recreational vehicle PCE, ER	2.0		2.0		2.0		
Heavy vehicle adjustment, fHV	0.826		0.806		0.870		
Driver population factor, fP	1.00		1.00		1.00		

Flow rate, vp 4255 336 141 pcph

Estimation of V12 Diverge Areas

L_{EQ} = 983.75 (Equation 13-12 or 13-13)

P_{FD} = 0.638 Using Equation 9

$v_{12} = v_R + (v_F - v_R) P_{FD}$ = 2837 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
$v_{Fi} = v_F$	4255	7200	No
$v_{FO} = v_F - v_R$	3919	7200	No
v_R	336	2100	No
v_3 or v_{av34}	1418 pc/h	(Equation 13-14 or 13-17)	

Is v_3 or v_{av34} > 2700 pc/h? No

Is v_3 or v_{av34} > 1.5 v_{12}/2 No

If yes, v_{12A} = 2837 (Equation 13-15, 13-16, 13-18, or 13-19)

Flow Entering Diverge Influence Area

	Actual	Max Desirable	Violation?
v_{12}	2837	4400	No

Level of Service Determination (if not F)

Density, $D_R = 4.252 + 0.0086\ v_{12} - 0.009\ L_D$ = 19.7 pc/mi/ln

Level of service for ramp-freeway junction areas of influence B

Speed Estimation

Intermediate speed variable, D_S = 0.393

Space mean speed in ramp influence area, S_R = 59.0 mph

Space mean speed in outer lanes, S_O = 75.2 mph

Space mean speed for all vehicles, S = 63.5 mph

Estimation of V12 Diverge Areas

L_{EQ} = (Equation 13-12 or 13-13)

P_{FD} = 0.651 Using Equation 9

$v_{12} = v_R + (v_F - v_R) P_{FD}$ = 2471 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
$v_{Fi} = v_F$	3559	7200	No
$v_{FO} = v_F - v_R$	3113	7200	No
v_R	446	2100	No
v_3 or v_{av34}	1088 pc/h	(Equation 13-14 or 13-17)	

Is v_3 or v_{av34} > 2700 pc/h? No

Is v_3 or v_{av34} > 1.5 v_{12}/2 No

If yes, v_{12A} = 2471 (Equation 13-15, 13-16, 13-18, or 13-19)

Flow Entering Diverge Influence Area

	Actual	Max Desirable	Violation?
v_{12}	2471	4400	No

Level of Service Determination (if not F)

Density, $D_R = 4.252 + 0.0086\, v_{12} - 0.009\, L_D$ = 17.9 pc/mi/ln

Level of service for ramp-freeway junction areas of influence B

Speed Estimation

Intermediate speed variable, D_S = 0.403

Space mean speed in ramp influence area, S_R = 58.7 mph

Space mean speed in outer lanes, S_O = 76.4 mph

Space mean speed for all vehicles, S = 63.2 mph

$v_{12} = v_F (P_{FM})$ = 2013 pc/h

Capacity Checks

	Actual	Maximum	LOS F?
v_{FO}	3579	7200	No
v_3 or v_{av34}	1381 pc/h	(Equation 13-14 or 13-17)	
Is v_3 or v_{av34}	> 2700 pc/h?	No	
Is v_3 or v_{av34}	> 1.5 v_{12} /2	Yes	

If yes, v_{12A} = 2013 (Equation 13-15, 13-16, 18, or 19)

Flow Entering Merge Influence Area

	Actual	Max Desirable	Violation?
v_{12A}	2198	4600	No

Level of Service Determination (if not F)

Density, $D_R = 5.475 + 0.00734\ v_R + 0.0078\ v_{12} - 0.00627\ L_A$ = 19.1 pc/mi/ln

Level of service for ramp-freeway junction areas of influence B

Speed Estimation

Intermediate speed variable, M_S = 0.317

Space mean speed in ramp influence area, S_R = 61.1 mph

Space mean speed in outer lanes, S_O = 66.8 mph

Space mean speed for all vehicles, S = 63.2 mph
